#### ABSTRACT:

An immunological tolerance-inducing agent comprising a mucosa-binding molecule linked to a specific tolerogen is disclosed. Further, a method of inducing immunological tolerance in an individual against a specific antigen, including hapten, which causes an unwanted immune response in said individual comprising administration by a mucosal route of an immunologically effective amount of an immunological tolerance-inducing agent of the invention to said individual, is described.

#### BSPR:

The way in which the specific tolerogen is linked to a mucosa-binding molecule in an immunological tolerance-inducing agent of the invention is not important as long as said tolerogen and said molecule can perform their respective function. Thus, they may be linked to each other directly by simple chemical procedures. Chemical procedures to couple proteins such as the B subunit of cholera toxin (CTB) or the thermolabile enterotoxin of *Escherichia coli* (LTB) to lipids, haptens, carbohydrates, nucleic acids as well as to other proteins including antibodies and synthetic peptides are well known in the art (e.g. see Carlsson, J. et al 1978. *Biochem. J.* 173:723-737; Cumber, J. A. et al. 1985. *Methods in Enzymology* 112:207-224; Walden, P. et al. 1986. *J. Mol. Cell Immunol.* 2:191-197; Gordon, R. D. et al. 1987. *Proc. Natl. Acad. Sci. (USA)* 84:308-312; Avrameas, S. and Ternynck, T. 1969. *Immunochemistry* 6:53; Joseph, K. C., Kim, S. U., Stieber, A., Gonatas, N. K. 1978. *Proc. Natl. Acad. Sci. USA* 75:2815-2819; Middlebrook, J. L. and Kohn, L. D. (eds): 1981. *Receptor-mediated binding and internalization of toxins and hormones. Academic Press, New York*, pp 311-350). The tolerogen can also be fused genetically to the CTB (or LTB) gene (Sanchez, J., Svennerholm, A-M and Holmgren, J. 1988. Genetic fusion of a non-toxic heat-stable enterotoxin-related deca-peptide antigen to cholera toxin B subunit. *FEBS Letters* 241:110-114) and the resulting chimeric gene then be expressed in a suitable expression system, such as a bacteria, a yeast or a virus. Alternatively, the tolerance inducing agent may comprise a fragment of a nucleic acid sequence (DNA or RNA) or a synthetic polynucleotide encoding the tolerogen which is then chemically coupled to the mucosa-binding molecule and administered by the mucosal route, advantage being then taken of the capacity of cells from host mucosal tissues to ensure transcription and/or translation of the corresponding gene into a mature protein (Rohrbaugh, M. L. and McGowan, J. J. 1993. Gene-transfer for therapy

7-1 infection. Ann. N.Y. Acad. Sci. Vol 685, pp  
 and Felgner, P. L., 1993. Direct gene-transfer for  
 immunization. Trends in Biotechnology Vol 11 No. 5, pp  
 L. Hunt, L. A., Webster, R. G. 1993. Protection against  
 challenge by immunization with a  
 ing plasmid DNA. Vaccine 11:957-960; Martinon, F.,  
 and Meulien, P. 1993. Eur. J. Immunol. 23:1719-1722). Yet other alternative  
 presentation forms could consist in the incorporation of the tolerogen or its  
 nucleic acid precursor into a protective vehicle such as a liposome or  
 equivalent biodegradable vesicles onto which the mucosa-binding substance had  
 been or shall be attached allowing efficient binding of the  
 tolerogen-containing vehicle to a mucosal surface for improved tolerogenic  
 efficacy. With this type of presentation form, the tolerogen may be either  
 free or linked to another molecule.

#### BSPR:

Recombinant cholera toxin B subunit (CTB) was produced in a mutant strain of  
 Vibrio cholerae deleted of the cholera toxin genes and transfected with a  
 plasmid encoding the CTB subunit (Sanchez, J. and Holmgren, J. 1989.  
 Recombinant system for over-expression of cholera toxin B subunit in Vibrio  
 cholerae as a basis for vaccine development. Proc. Natl. Acad. Sci. USA  
 86:481-485). Recombinant B subunit of Escherichia coli heat-labile enterotoxin  
 (LTB) was produced similarly in a mutant strain of Vibrio cholerae deleted of  
 the cholera toxin genes and transfected with a plasmid encoding E. coli LTB  
 (Hirst, T. R., Sanchez, J. Kaper, J. B., Hardy, S. J. S., and Holmgren, J. 1984.  
 Mechanism of toxin secretion by Vibrio cholerae investigated in strains  
 harbouring plasmids that encode heat-labile enterotoxins of Escherichia coli.  
 Proc. Natl. Acad. Sci. USA 81:7752-7756). In these expression Systems, CTB  
 and LTB are recovered from bacterial growth media as secreted proteins.  
 Bacterial cultures were centrifuged at 8000 rev per min for 20 min and the  
 supernatants were collected and adjusted to pH 4.5 with dilute HCl. After  
 precipitation with hexametaphosphate (final concentration 2.5 g/l) for 2 hours  
 at 23.degree. C. followed by centrifugation at 8000 rev per min, the pellets  
 were dissolved with 0.1M sodium phosphate buffer, pH 8.0 and dialysed against  
 0.01M phosphate-buffered saline, pH 7.2. The dialysate was then centrifuged at  
 15 000 rev per min to remove residual insoluble material and the supernatant  
 was further clarified by filtration through a 0.22 .mu.m filter (Millipore,  
 Bedford, Mass.). Finally, CTB and LTB were purified by standard gel filtration  
 chromatography through columns of Sephadex G-100 (Pharmacia, Sweden).

#### CLPR:

1. A method of inducing immunological tolerance in a mammal to a  
 T-cell-associated immunological response, which comprises administering by a  
 mucosal route to a mammal suffering from or prone to a T-cell associated  
 disease an immunological tolerance-inducing agent, wherein said agent comprises  
 (i) a mucosa-binding molecule selected from the group consisting of the B  
 subunit of cholera toxin and the B subunit of heat-labile enterotoxin of  
 Escherichia coli, linked to (ii) a specific tolerogen associated with said  
 T-cell associated immune response, and wherein said agent is administered in an  
 amount and for a time effective to induce tolerance against said T-cell  
 associated immune response.
